The Sequence contained an oligo-dT track that was present in the
oligonucleotide that was used to prime the synthesis of first
strand cDNA and therefore this may represent a bonafide poly A
tail. The sequence tag present in the cDNA between the NotI site
and the oligo-dT track served to verify it as a clone from the
non-normalized atrium at 16.5 dpc library cDNA Library Preparation:
M.B. Soares Lab Clone distribution: clones will be available

The sequence contained an oligo-dT track that was present in the
OligonucLeotide that was used to prime the synthesis of first
strand cDNA and therefore this may represent a bonafide poly A
tail. The sequence tag present in the cDNA between the NotI site
and the oligo-dT track served to identify it as a clone from the
normalized ventricle at 13 dpc library cDNA Library Preparation:
M.B. Soares Lab Clone distribution: clones will be available

This immunogenic polypeptide is immunochemically reactive with monoclonal antibodies against P. vivax CS protein and is useful in a vaccine against malaria. It may be prepared by recombinant DNA techniques in yeast.

This novel protein may have biological activity, e.g. nutritional activity, cytokine and cell proliferation/differentiation activity, immune stimulating or suppressing activity, haematopoiesis regulating activity, tissue growth activity, activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, cadherin/tumour invasion suppressor activity, tumour inhibition activity or other activities.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes new human secreted proteins which were considered from adult placenta, adult retina, foetal brain, foetal kidney, adult blood, adult blood, adult brain, adult trestal, adult blood, adult blooder, adult neural consistency adult testes, and adult lymph node cDNA ilbraries. The human conserved proteins, and the polynucleotides encoding them, are predicted to have biological activities which would make them suitable for containing preventing or ameliorating medical conditions in humans and cannals. Suggested activities include nutritional activity, cytokine and cell proliferation/differentiation activity, immune stimulating contivity, as a vaccines) or suppressing activity, haematopoissis regulating contivity, tissue growth activity, activin/inhibin activity, contivity, tissue growth activity, activin/inhibin activity, cativity, receptor/ligand activity, anti-inflammatory activity, cativity, receptor/ligand activity, anti-inflammatory activity, activity, and tumour inhibition contivity. The polynucleotides are also stated to be useful for gene contivity. The polynucleotides are also stated to be useful for gene contivity. The polynucleotides are also stated to be useful for gene continued the polynucleotides are also stated to be useful for gene continued the polynucleotides are also stated to be useful for gene continued the polynucleotides are also stated to be useful for gene continued the polynucleotides are also stated to be useful for gene continued the polynucleotides are also stated to be useful for gene continued the polynucleotides are also stated to be useful for gene continued the polynucleotides are also stated to be useful for gene continued the polynucleotides are also stated to be useful for gene continued the polynucleotides are also stated to be useful for gene continued the polynucleotides are also stated to be useful for gene continued the polynucleotides are also stated to 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                REC2 in a cell was found to facilitate homologous recombination between an exogenous DNA and the genome of a cell. It also sensitises the cell to DNA damage, e.g. by gamma or UV radiation or from cytotoxic agents. This causes the cell to undergo apoptosis in response to DNA damage. MuREC2 can be used to construct transgenic animals. REC2 knock-out mice are useful as models for tumorigenesis induced by chemical carcinogens. The harEC2 human homologue gene (see V22703) is also claimed, which can be used in
                                                                                                                                                                                                                                                                                                                               2240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This polynucleotide corresponds to the mouse homologue, the REC2 gene (UmREC2) of Ustilago maydis, and codes fo dependent recombinase (see W56265).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     in the same supergene family as the mammmalian protein having homologous pairing and strand transfer activities, RAD51 and was isolated because of its homology to the homologous pairing and strand transfer protein of Ustilago maydis. In particular, muRec2 phosphorylates several proteins that control the cell cycle, especially cyclin E and p53. The invention permits the phosphorylation of cell cycle control proteins at sites that are physiologically relevant. The invention can be practiced with either murine or human Rec2 or a mutein or chimera of these proteins. In particular the mutein has the sequence of a Rec2 kinase containing other than a Tyr at position 163. The invention comprises a method of

                                                                                                                                                                                                                                                                                                                                                                               В
                                                                                                                                                                                                                                                                                                                                                                                                                 Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This is a nucleotide sequence of the stabilising sequence-encoding CC insert. The invention provides a method for increasing the resistance of a core protein to proteolytic degradation that comprises linking or CC inserting onto or into the core protein a stabilising polypeptide of CC formula [(Glya)X(Glyb)Y(Glyc)2]n where Glya, Glyb, Glyc are 1-6 cc sequential Gly residues and X, X, Z are Ala, Ser, Val, IIe, Leu, Met, Phe, Pro or Thr and n can be anything between 1-66. X, Y and Z need not CC be identical from n repeat to n repeat. Alternatively a nucleic acid encoding the stabilising polypeptide can be linked onto or inserted into a nucleic acid encoding a core protein. The fusion proteins of the livention are more resistant to degradation by proteases and, thus, have CC invention are more resistant to degradation by proteases and, thus, have compare half-life than the unfused core protein. The products can be cused for treating autoimmune diseases, cancer and inflammation. In particular, the core protein may be an IxappaB regulator protein for the CC treatment of inflammatory bowel disease, or a nitroreductase protein conditions. The fusion proteins can also be used in or other pathological conditions. The fusion proteins can also be used in CC disangustic methods such as in vivo immedian
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       diagnostic methods such as in vivo imaging.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New fusion proteins resistant to proteolytic degradation comprising a core protein with a stabilising polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure; Fig 4B; 120pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    a peptide sequence containing glycine repeats
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 1998-312463/27

Antigen I (EBNA 1), which is obtained from commercially available plasmid proverse. But it is not to be stably maintain episomes containing EBV origin of replication (orif) and a gene encoding protein or RNA of interest. Eucaryotic host cells expressing EBNA 1 protein are transfected with these episomes to produce recombinant cell lines expressing multiple genes of interest. This provides a rapid and reliable method of stably expressing multiple genes in transfected cells. The episomes are useful in the transfection of genes encoding receptors, transporter proteins, ion channels, adhesion molecules and transcription factors. The episomes carrying desired genes can also be used to transfect cells in gene therapy, antisense therapy, for gene amplification, cell immortalisation, etc.

       The present sequence is an anti-sense strand of commercially available plasmid pCMYDBNA from which Epstein Barr Virus Nuclear Antigen 1 (EBNA 1) encoding DNA is obtained. EBNA 1 protein is used to stably maintain episomes containing EBV origin of replication (orif) and a gene encoding protein or RNA of interest. Eucaryotic host cells expressing EBNA 1 protein are transfected with these episomes to produce recombinant cell lines expressing multiple genes of interest. This provides a rapid and reliable method of stably expressing multiple genes in transfected cells. The episomes are useful in the transfection of genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Anti-sense strand; plasmid pCMVEBNA; EBNA 1; episome; transfection; Epstein Barr Virus Nuclear Antigen 1; origin of replication; EBV orip; eucaryotic host cell; recombinant cell line; ion channel;

```

The present invention describes an apoptosis-resistant virus-sensitive cell line into which an apoptosis resistance gene has been introduced. The recombinant viruses generated are capable of expressing apoptosis-associated genes. These can then be used in a variety of diseases for which the induction of apoptosis by gene transfer, or where the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CC inhibition of harmful apoptosis, is therapeutic. The recombinant viruses CC are useful as vectors for gene therapy which can be applied to cancer CC therapy for destroying cancer cells selectively, the treatment of CC autoimmune diseases and graft rejection reaction, and apoptosis induction CC therapy for inflammatory cells in inflammatory diseases. Prior arts have CC encountered the problem where if an adenovirus vector capable of CC the cells producing the virus will be destroyed because the period of CC time required to induce cell death by apoptosis is shorter than that CC required to replicate and produce the virus, resulting in failure to Obtain a recombinant virus having the integrated apoptosis-associated GC enc. In this invention an apoptosis-resistant 293 cell line (having an CC apoptosis resistant gene introduced) is established and overcomes the CC problem. The present sequence represents the base sequence of the CC plasmid pRx-ires-bsr, which contains the cowpox virus bsr gene, and CC is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       cc which the induction of apoptosis by gene transfer, or where the cinhibition of harmful apoptosis, is therapeutic. The recombinant viruses care useful as vectors for gene therapy which can be applied to cancer ct therapy for destroying cancer cells selectively, the treatment of cautoimmune diseases and graft rejection reaction, and apoptosis induction ct therapy for inflammatory cells in inflammatory diseases. Prior arts have encountered the problem where if an adenovirus vector capable of cexpressing an apoptosis associated gene is introduced into animal cells, the cells producing the virus will be destroyed because the period of time required to induce cell death by apoptosis is shorter than that crequired to replicate and produce the virus, resulting in failure to obtain a recombinant virus having the integrated apoptosis-associated gene. In this invention an apoptosis-resistant 293 cell line (having an apoptosis resistant gene introduced) is established and overcomes the prosent sequence represents the base sequence of the cplasmid pRx-Bcl-xl-bsr, which contains the human Bcl-xl gene, and cc is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  which the induction of apoptosis by gene transfer, or where the inhibition of harmful apoptosis, is therapeutic. The recombinant viruses are useful as vectors for gene therapy which can be applied to cancer therapy for destroying cancer cells selectively, the treatment of autoimmune diseases and graft rejection reaction, and apoptosis induction therapy for inflammatory cells in inflammatory diseases. Prior arts have encountered the problem where if an adenovirus vector capable of expressing an apoptosis-associated gene is introduced into animal cells, the cells producing the virus will be destroyed because the period of time required to induce cell death by apoptosis is shorter than that required to replicate and produce the virus, resulting in failure to obtain a recombinant virus having the integrated apoptosis-associated gene. In this invention an apoptosis-resistant 293 cell life (having an apoptosis resistant gene introduced) is established and overcomes the components resistant gene introduced) is established and overcomes the components of the present sequence represents the cowpox virus bar gene which the sused in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ϋ́
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           which the induction of apoptosis by gene transfer, or where the inhibition of harmful apoptosis, is therapeutic. The recombinant viruses are useful as vectors for gene therapy which can be applied to cancer therapy for destroying cancer cells selectively, the treatment of autoimmune diseases and graft rejection reaction, and apoptosis induction therapy for inflammatory cells in inflammatory diseases. Prior arts have encountered the problem where if an adenovirus vector capable of expressing an apoptosis-associated gene is introduced into animal cells, the cells producing the virus will be destroyed because the period of time required to induce cell death by apoptosis is shorter than that required to replicate and produce the virus, resulting in failure to obtain a recombinant virus having the integrated apoptosis-associated gene. In this invention an apoptosis-resistant 293 cell line (having an apoptosis resistant gene introduced) is established and overcomes the problem. The present sequence represents the base sequence of the plasmid present sequence represents the base sequence and

                                                                                                                                                                                                                                                                                                                                    antisense-mediated inhibition of a selected gene. The use of a direct library for target site selection significantly simplifies the screening process, since only very small libraries need be prepared and assayed. This sequence represents the vector pShuttle which is used in the method of the invention.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  δÃ
                                The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                       22-JUN-1998;
